# 1. Product Overview

## 1.1 Introduction of Innodisk mSATA 3IE3

Innodisk mSATA 3IE3 is designed with mSATA form factor by MO-300/MO-300B which established by JEDEC , and supports SATA III standard (6.0Gb/s) with excellent performance. Regarding of mechanical interference, Innodisk mSATA 3IE3 absolutely replaces the traditional hard disk and makes personal computer, in any field, smaller and easier.

Innodisk mSATA 3IE3 effectively reduces the booting time of operation system and the power consumption is less than hard disk drive (HDD), and complies with ATA protocol, no additional drives are required, and can be configured as a boot device or data storage device

## 1.2 Product View and Models

Innodisk mSATA 3IE3 is available in follow capacities within MLC flash ICs.

## 2.1 SATA Interface

Innodisk mSATA 3IE3 supports SATA III(6.0Gb/s) interface, and compliant with SATA I (1.5Gb/s) and SATA II(3.0Gb/s).

## 2. Product Specifications

### 2.1 Capacity and Device Parameters

mSATA 3IE3 device parameters are shown in Table 1.

### 2.4.4 Mean Time between Failures (MTBF)

Table 7 summarizes the MTBF prediction results for various mSATA 3IE3 configurations. The analysis was performed using a RAM Commander™ failure rate prediction.

- **Failure Rate:** The total number of failures within an item population, divided by the total number of life units expended by that population, during a particular measurement interval under stated condition.
- **Mean Time between Failures (MTBF):** A basic measure of reliability for repairable items: The mean number of life units during which all parts of the item perform within their specified limits, during a particular measurement interval under stated conditions.

<b>Product</b>	<b>Condition</b>			<b>MTBF (Hours)</b>
Innodisk mSATA 3IE3	Telcordia	SR-332	GB, 25°C	>3,000,000

## 2.5 CE and FCC Compatibility

mSATA 3IE3 conforms to CE and FCC requirements.

## 2.6 RoHS Compliance

mSATA 3IE3 is fully compliant with RoHS directive.

## 2.7 Reliability

<b>Parameter</b>		<b>Value</b>

\* Note:

1. Sequential: Mainly sequential write, tested by Vdbench.
2. Client: Follow JESD218 Test method and JESD219A Workload, tested by ULINK. (The capacity lower than 64GB client workload is not specified in JEDEC219A, the values are estimated.)
3. Based on out-of-box performance.

## 2.8 Transfer Mode

mSATA 3IE3 support following transfer mode:

Serial ATA III 6.0Gbps  
Serial ATA II 3.0Gbps  
Serial ATA I 1.5Gbps

## 2.9 Pin Assignment

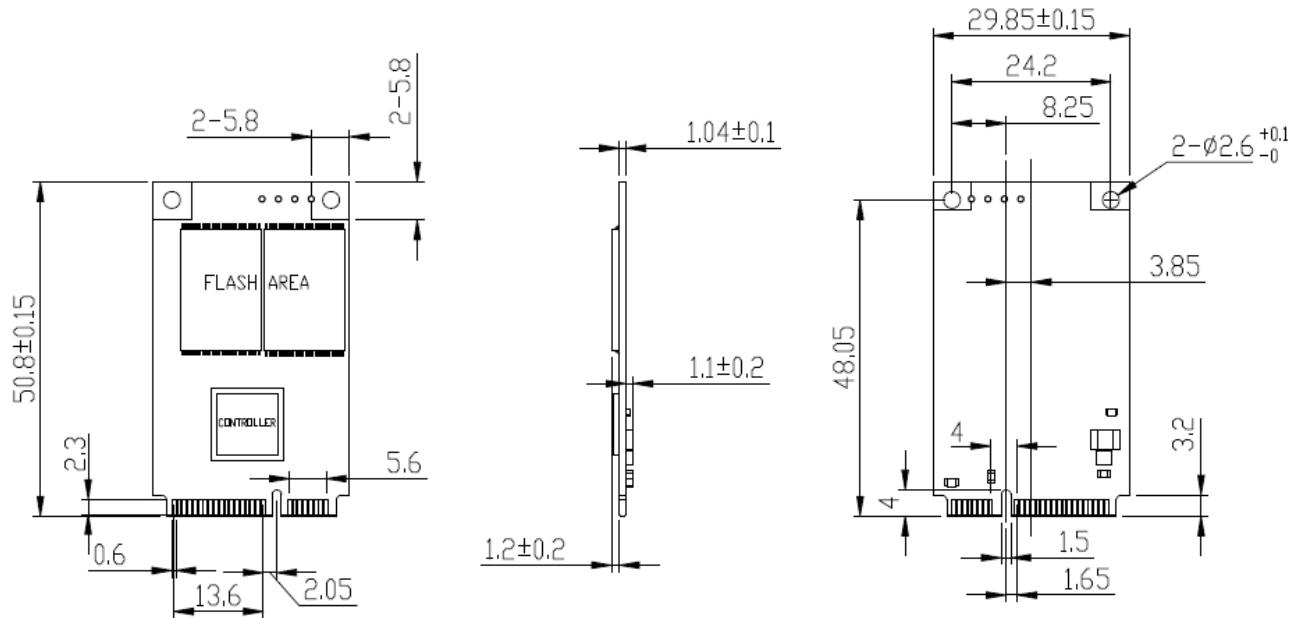

Innodisk mSATA 3IE3 uses a standard SATA pin-out. See Table 8 for mSATA 3IE3 pin assignment.

## 2.10 Mechanical Dimensions

## 2.11 Assembly Weight

An Innodisk mSATA 3IE3 within flash ICs, 32GB's weight is 8 grams approximately.

## 2.12 Seek Time

Innodisk mSATA 3IE3 is not a magnetic rotating design. There is no seek or rotational latency required.

## 2.13 NAND Flash Memory

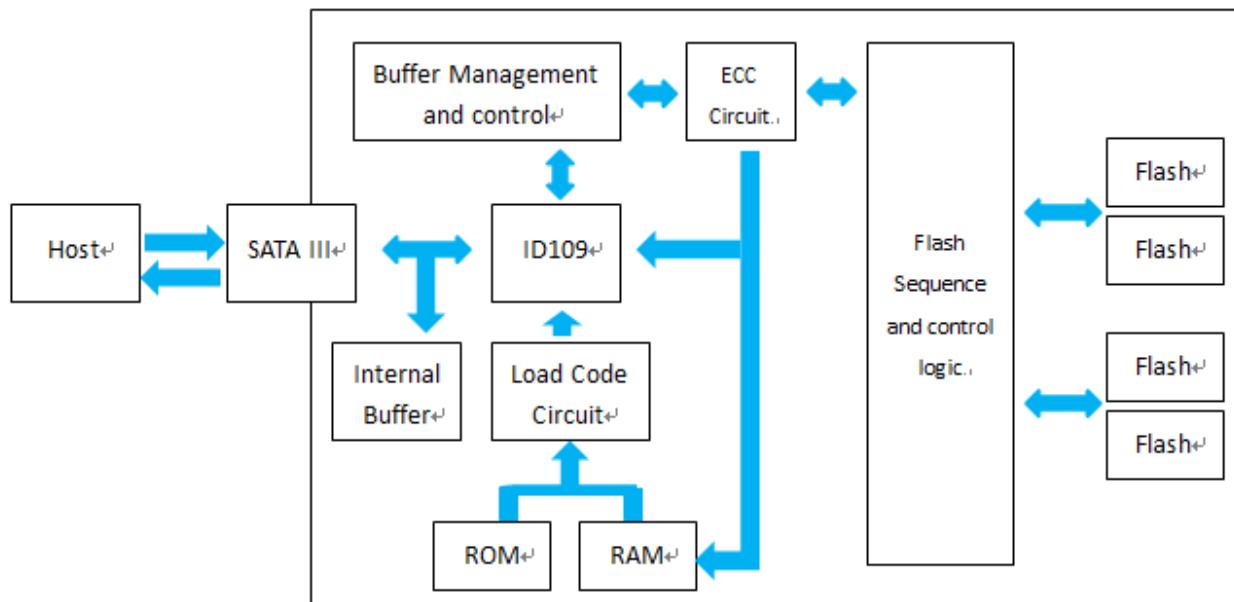

Innodisk mSATA 3IE3 uses Multi Level Cell (MLC) NAND flash memory, which is non-volatility, high reliability and high speed memory storage. Each cell stores 2 bits or holds four states per cell. Read or Write data to flash memory for SSD is control by microprocessor.

# 3. Theory of Operation

## 3.1 Overview

Figure 2 shows the operation of Innodisk mSATA 3IE3 from the system level, including the major hardware blocks.

**Figure 2: Innodisk mSATA 3IE3 Block Diagram**

Innodisk mSATA 3IE3 integrates a SATA III controller and NAND flash memories. Communication with the host occurs through the host interface, using the standard ATA protocol. Communication with the flash device(s) occurs through the flash interface.

## 3.2 SATA III Controller

Innodisk mSATA 3IE3 is designed with ID 109 / ID108, a SATA III 6.0Gbps (Gen. 3) controller. The Serial ATA physical, link and transport layers are compliant with Serial ATA Gen 1, Gen 2 and Gen 3 specification (Gen 3 supports 1.5Gbps/3.0Gbps/6.0Gbps data rate). The controller has 2 / 4 channels for flash interface.

### 3.3 Error Detection and Correction

Highly sophisticated Error Correction Code algorithms are implemented. The ECC unit consists of the Parity Unit (parity-byte generation) and the Syndrome Unit (syndrome-byte computation). This unit implements an algorithm that can correct 40 bits per 1024 bytes in an ECC block. Code-byte generation during write operations, as well as error detection during read operation, is implemented on the fly without any speed penalties.

### 3.4 Wear-Leveling

Flash memory can be erased within a limited number of times. This number is called the **erase cycle limit** or **write endurance limit** and is defined by the flash array vendor. The erase cycle limit applies to each individual erase block in the flash device.

Innodisk mSATA 3IE3 uses a static wear-leveling algorithm to ensure that consecutive writes of a specific sector are not written physically to the same page/block in the flash. This spreads flash media usage evenly across all pages, thereby extending flash lifetime.

### 3.5 Bad Blocks Management

Bad Blocks are blocks that contain one or more invalid bits whose reliability are not guaranteed. The Bad Blocks may be presented while the SSD is shipped, or may develop during the life time of the SSD. When the Bad Blocks is detected, it will be flagged, and not be used anymore. The SSD implement Bad Blocks management, Bad Blocks replacement, Error Correct Code to avoid data error occurred. The functions will be enabled automatically to transfer data from Bad Blocks to spare blocks, and correct error bit.

### 3.6 Power Cycling

Innodisk's power cycling management is a comprehensive data protection mechanism that functions before and after a sudden power outage to SSD. Low-power detection terminates data writing before an abnormal power-off, while table-remapping after power-on deletes corrupt data and maintains data integrity. Innodisk's power cycling provides effective power cycling management, preventing data stored in flash from degrading with use.

### 3.7 Garbage Collection

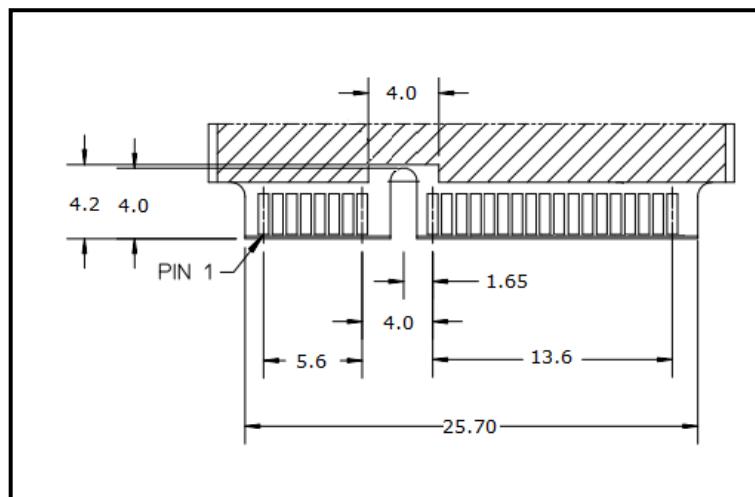

Garbage collection is used to maintain data consistency and perform continual data cleansing on SSDs. It runs as a background process, freeing up valuable controller resources while sorting good data into available blocks, and deleting bad blocks. It also significantly reduces write operations to the drive, thereby increasing the SSD's speed and lifespan.

### 3.8 Trim

The Trim command is designed to enable the operating system to notify the SSD which pages no longer contain valid data due to erases either by the user or operating system itself. During a delete operation, the OS will mark the sectors as free for new data and send a Trim command to the SSD to mark them as not containing valid data. After that the SSD knows not to preserve the contents of the block when writing a page, resulting in less write amplification with fewer writes to the flash, higher write speed, and increased drive life.

## 4. Installation Requirements

### 4.1 mSATA 3IE3 Pin Directions

**Figure 3: Signal Segment and Power Segment**

### 4.2 Electrical Connections for mSATA 3IE3

A Serial ATA device may be either directly connected to a host or connected to a host through an adaptor card. The SATA interface has a separate connector for the power supply. Please refer to the pin description for further details.

### 4.3 Device Drive

No additional device drives are required. The Innodisk mSATA 3IE3 can be configured as a boot device.
