REVISION HISTORY

Revision	Description	Date
Preliminary	First Released	2012/08/30
Rev. 1.0	1. mSATA 4GB and 64GB 2. Update part number rule 3. Add CE/FCC certificate 4. Update MTBF as 3,000,000 hours 5. Update dimension 6. Update power consumption 7. Update Part Number Rule 8. Update drawing format (vector) 9. Add RoHS declaration	2013/04/08

List of Figures

1. Product Overview

1.1 Introduction of MSATA 2SR

mSATA 2SR series provides high capacity flash memory Solid State Drive (SSD) that electrically complies with Serial ATA (SATA) II 3.0G standard and delivers excellent performance, 2SR's sustained read speed can reach up to 110 MB per second (max.) while sustained write reach up to 90 MB per second (max); and complies with ATA protocol and supports TRIM command set.

Moreover, Innodisk mSATA 2SR is designed as the standard Mini PCIe form factor, and compatible with Mini PCIe slot, which is suitable in industrial field, it effectively reduces the booting time of operation system and the power consumption is less than hard disk drive (HDD). It can work under harsh environment, complies with ATA protocol, no additional drives are required, and can be configured as a boot device or data storage device.

mSATA 2SR is designed for military field, which provides several data security functions, including SEraser, QEraser, Destroy, and Write Protect.

1.2 Product View

Figure 1: mSATA 2SR

1.3 Product Models

mSATA 2SR is available in follows capacities, within SLC flash ICs:

mSATA 2SR 4GB mSATA 2SR 8GB mSATA 2SR 16GB mSATA 2SR 32GB mSATA 2SR 64GB

1.4 MO-300 form factor

mSATA 2SR has a compact design 50.80mm (L) x 29.85mm (W) x 4.05 mm (H) without metal material case, and is easy for installation.

2. Theory of operation

2.1 Overview

Figure 2 shows the operation of mSATA 2SR from the system level, including the major hardware blocks.

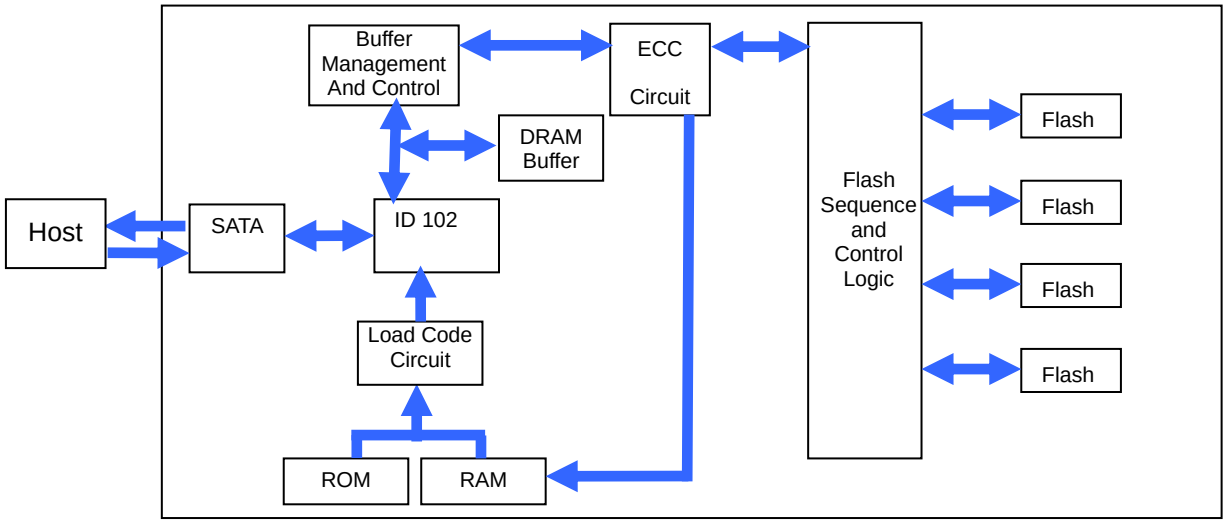

Figure 2: mSATA 2SR Block Diagram

mSATA 2SR integrates a SATA II controller and NAND flash memories. Communication with the host occurs through the host interface, using the standard ATA protocol. Communication with the flash device(s) occurs through the flash interface.

2.2 SATA II Controller

The SATA II controller is 3.0 Gbps (Gen. 2), and support hot-plug. The Serial ATA physical, link and transport layers are compliant with Serial ATA Gen 1 and Gen 2 specification (Gen 2 supports 1.5Gbps/3.0Gbps data rate). The controller has 4 channels for flash interface.

2.3 Error Detection and Correction

Highly sophisticated Error Correction Code algorithms are implemented. The ECC unit consists of the Parity Unit (parity-byte generation) and the Syndrome Unit (syndrome-byte computation). This unit implements an algorithm that can correct 24 bits per 1024 bytes in an ECC block. Code-byte generation during write operations, as well as error detection during read operation, is implemented on the fly without any speed penalties.

2.4 Wear-Leveling

Flash memory can be erased within a limited number of times. This number is called the ***erase cycle limit*** or

write endurance limit and is defined by the flash array vendor. The erase cycle limit applies to each individual erase block in the flash device.

MSATA 2SR uses a static wear-leveling algorithm to ensure that consecutive writes of a specific sector are not written physically to the same page/block in the flash. This spreads flash media usage evenly across all pages, thereby extending flash lifetime.

2.5 Bad Blocks Management

Bad Blocks are blocks that contain one or more invalid bits whose reliability are not guaranteed. The Bad Blocks may be presented while the SSD is shipped, or may develop during the life time of the SSD. The Bad Blocks will not exceed more than 2% of the total device volume. When the Bad Blocks is detected, it will be flagged, and not be used anymore. The SSD implement Bad Blocks management, Bad Blocks replacement, Error Correct Code to avoid data error occurred. The functions will be enabled automatically to transfer data from Bad Blocks to spare blocks, and correct error bit.

2.6 TRIM

TRIM is one of commands of the ATA Data Set Management Command (also called *DisableDeleteNotify*). The command allows the operating system* to inform the disk which data blocks are no longer in use and can be erased internally to restore the disk space in advance, as well as to ensure endurance and performance.

* TRIM is supported by Microsoft Windows 7, Windows Server 2008, and newer operating systems.

3. Installation Requirements

3.1 mSATA 2SR Pin Directions

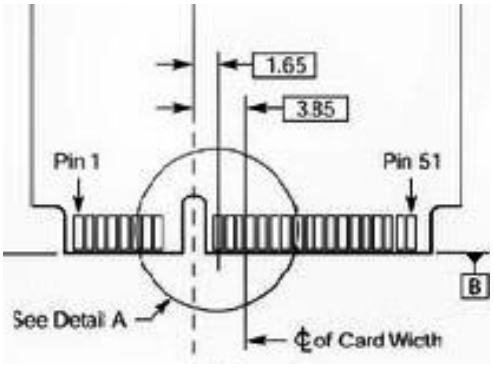

Figure 3: Signal Segment

3.2 Device drive

No additional device drives are required. The mSATA 2SR can be configured as a boot device.

4. Specifications

4.1 CE and FCC Compatibility

mSATA 2SR conforms to CE and FCC requirements.

4.2 RoHS Compliance

mSATA 2SR is fully compliant with RoHS directive.

4.3 Environmental Specifications

mSATA 2SR is compliant with MIL-STD-810G/F specifications.

4.3.1 Temperature Ranges

Operating Temperature Range:

- Standard Grade：0°C to +70°C
- Industrial Grade：-40°C to +85°C

Storage Temperature Range:

- -55°C to +95°C

4.3.2 Humidity

Relative Humidity: 5-95%, non-condensing

4.3.3 Shock and Vibration

Table 1: Shock/Vibration Testing for MSATA 2SR

Reliability	Test Conditions	Reference Standards
Vibration	20G, 7 Hz to 2K Hz, 3 axes	MIL-STD-810F 514.5 MIL-STD-810G 514.6
Shock	1500G, 0.5ms, 3 axes	MIL-STD-810F 516.5 MIL-STD-810G 516.6

4.3.4 Mean Time between Failures (MTBF)

Table 2 summarizes the MTBF prediction results for MSATA 2SR. The analysis was performed using a RAM Commander™ failure rate prediction.

- **Failure Rate**: The total number of failures within an item population, divided by the total number of life units expended by that population, during a particular measurement interval under stated condition.

- **Mean Time between Failures (MTBF)**: A basic measure of reliability for repairable items: The mean number of life units during which all parts of the item perform within their specified limits, during a particular measurement interval under stated conditions.

Table 2: MSATA 2SR MTBF

Product	Condition	MTBF (Hours)
mSATA 2SR	Telcordia SR-332 GB, 25°C	>3,000,000

4.4 Transfer Mode

mSATA 2SR support following transfer mode:

PIO Mode 0~4

Ultra DMA 0~6

Serial ATA I 1.5Gbps

Serial ATA II 3.0Gbps

4.5 Pin Assignment

MSATA 2SR uses a standard SATA pin-out. See Table 3 for MSATA 2SR pin assignments.

Table 3: MSATA 2SR Pin Assignment

Signal Name	Pin #	Pin #	Signal Name
NC	51	52	+3.3V

4.6 Mechanical Dimensions

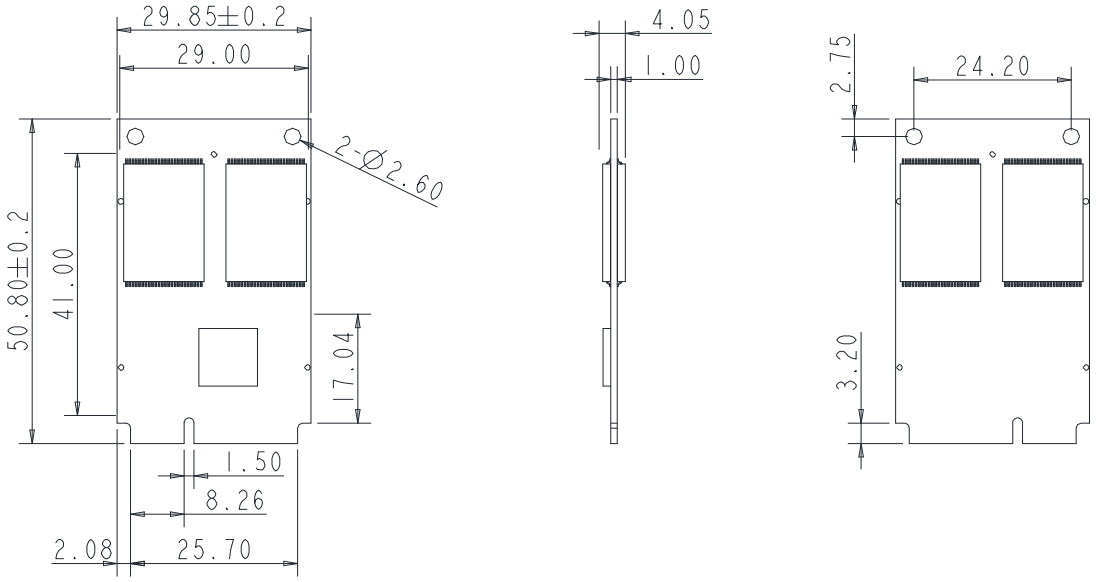

Figure 4: MSATA 2SR mechanical dimensions

4.7 Assembly weight

An MSATA 2SR within flash ICs, SLC 16GB's weight is 8 grams approx. If the capacity is different, the flash chip's weight needs to be added. The total weight of SSD will be less than 10 grams.

4.8 Performance

Burst Transfer Rate: 3.0 Gbps

Burst Transfer Rate: 3.0 Gbps

SLC	4GB	8GB	16GB	32GB	64GB
Sequential Read (MB/sec.) (max.)	TBD	TBD	110	110	110
Sequential Write (MB/sec.) (max.)	TBD	TBD	90	90	90

4.9 Seek Time

MSATA 2SR is not a magnetic rotating design. There is no seek or rotational latency required.

4.10 NAND Flash Memory

MSATA 2SR uses Single Level Cell (SLC) NAND flash memory for 2SR series, which is non-volatility, high reliability and high speed memory storage. There are only two statuses 0 or 1 of one cell for SLC. Read or Write data to flash memory for SSD is control by micro processor.

4.11 Electrical Specifications

4.11.1 Power Requirement

Table 4: MSATA 2SR Power Requirement

Item	Symbol	Rating	Unit
Input voltage	V_{IN}	+3.3 DC ± 5% (max.)	V

4.12.2 Power Consumption

Table 5: Power Consumption

Mode	Power Consumption
Read	390mA
Write	520mA
Idle	290mA

Target: 64GB (SLC)

4.13 Device Parameters

MSATA 2SR device parameters are shown in Table 6.

Table 6: Device parameters

Capacity	LBA	Cylinders	Heads	Sectors	User Capacity (MB)
64GB	122880000	16383	16	63	60000
32GB	61440000	16383	16	63	30000
16GB	30720000	16383	16	63	15000
8GB	15360000	15238	16	63	7500
4GB	7680000	7619	16	63	3750

5. Supported ATA Commands

5.1 Supported ATA Commands

MSATA 2SR supports the commands listed in Table 7.

Table 7: ATA Commands

DRDY shall be set to one.

DF (Device Fault) shall be cleared to zero.

DRQ shall be cleared to zero.

ERR shall be cleared to zero.

5.1.2.7 Prerequisites

DRDY set to one.

5.1.2.8 Description

The IDENTIFY DEVICE command enables the host to receive parameter information from the device. When the command is issued, the device sets the BSY bit to one, prepares to transfer the 256 words of device identification data to the host, sets the DRQ bit to one, clears the BSY bit to zero, and asserts INTRQ if nIEN is cleared to zero. The host may then transfer the data by reading the Data register. Table 8 defines the arrangement and meaning of the parameter words in the buffer. All reserved bits or words shall be zero.

Some parameters are defined as a 16-bit value. A word that is defined as a 16-bit value places the most significant bit of the value on signal line DD15 and the least significant bit on signal line DD0. Some parameters are defined as 32-bit values (e.g. words (61:60)). Such fields are transfer using two successive word transfers. The device will first transfer the least significant bits, bits (15:0) of the value, on signal lines DD(15:0) respectively. After the least significant bits have been transferred, the most significant bits, bits(31:16) of the value, shall be transferred on DD(15:0) respectively.

Some parameters are defined as a string of ASCII characters.

Table 11: Identify device command parameters

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.6.6 Prerequisites

DRDY set to one.

5.1.6.7 Description

This command reads from 1 to 256 sectors as specified in the Sector Count register. A sector count of 0 requests 256 sectors. This transfer shall begin at the sector specified in the LBA Low, LBA Mid, LBA High, and Device registers. The DRQ bit is always set to one prior to data transfer regardless of the presence or absence of an error condition. The device shall interrupt for each DRQ block transferred.

Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Error register-

ICRC shall be set to one if an interface CRC error has occurred during an Ultra DMA data transfer. The content of this bit is not applicable for Multiword DMA transfers.

UNC shall be set to one if data is uncorrectable.

IDNF shall be set to one if a user-accessible address could not be found.

LBA Low, LBA Mid, and LBA High, Device

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.8.6 Prerequisites

DRDY set to one. The host shall initialize the DMA channel.

5.1.8.7 Description

The READ DMA command allows the host to read data using the DMA data transfer protocol.

5.1.9 Set Feature

5.1.9.1 Command Code

EFh

5.1.9.2 Feature set

General feature set

- Mandatory for all devices.

- Set transfer mode subcommand is mandatory.
- Enable/disable write cache subcommands are mandatory when a write cache is implemented.
- Enable/disable Media Status Notification sub commands are mandatory if the Removable Media feature set is implemented.
- All other subcommands are optional.

5.1.9.3 Protocol

Non-data

5.1.9.4 Inputs

Table 30 defines the value of the subcommand in the Feature register. Some subcommands use other registers, such as the Sector Count register to pass additional information to the device.

Table 30: Subcommand value of Feature register

Register	7	6	5	4	3	2	1	0
Features	Subcommand code							
Sector Count	Subcommand specific							
LBA Low	Subcommand specific							
LBA Mid	Subcommand specific							
LBA High	Subcommand specific							
Device	Obs	Na	obs	DEV	na			
Command	EFh							

Device register -

DEV shall specify the selected device.

5.1.9.5 Normal outputs

See the subcommand descriptions.

5.1.9.6 Error outputs

If any subcommand input value is not supported or is invalid, the device shall return command aborted.

Table 31: Set Features command for error output information

Register	7	6	5	4	3	2	1	0
Error	na	na	na	na	na	ABRT	na	na
Sector Count	na							
LBA Low	na							
LBA Mid	na							
LBA High	na							
Device	obs	na	obs	DEV	na			
Status	BSY	DRDY	DF	na	DRQ	na	na	ERR

Error register -

ABRT shall be set to one if this subcommand is not supported or if the value is invalid. ABRT may be set to one if the device is not able to complete the action requested by the command.

Device register -

DEV shall indicate the selected device.

Status register -

BSY shall be cleared to zero indicating command completion.

DRDY shall be set to one.

DF (Device Fault) shall be set to one if a device fault has occurred.

DRQ shall be cleared to zero.

ERR shall be set to one if an Error register bit is set to one.

5.1.9.7 Prerequisites

DRDY shall be set to one.

5.1.9.8 Description

This command is used by the host to establish parameters that affect the execution of certain device features. Table 32 defines these features.

At power-on, or after a hardware reset, the default settings of the functions specified by the subcommands are vendor specific

Table 32: SET FEATURES register definitions

Value (See note)	
02h	Enable write cache
03h	Set transfer mode based on value in Sector Count register. Table 42 defines values.
55h	Disable read look-ahead feature
82h	Disable write cache
AAh	Enable read look-ahead feature

5.1.9.9 Enable/ disable write cache

Subcommand codes 02h and 82h allow the host to enable or disable write cache in devices that implement write cache. When the subcommand disable write cache is issued, the device shall initiate the sequence to flush cache to non-volatile memory before command completion. This subcommand does not apply to commands that have a Flush to Disk bit.

5.1.9.10 Set transfer mode

A host selects the transfer mechanism by Set Transfer Mode, subcommand code 03h, and specifying a value in the Sector Count register. The upper 5 bits define the type of transfer and the low order 3 bits encode the mode value. The host may change the selected modes by the SET FEATURES command.

Table 33: Transfer mode values

Mode	Bits (7:3)	Bits (2:0)
PIO default mode	00000b	000b
PIO default mode, disable IORDY	00000b	001b
PIO flow control transfer mode	00001b	Mode
Retired	00010b	Na
Multiword DMA mode	00100b	Mode
Reserved	01000b	Mode
Mode = transfer mode number	10000b	na
Mode = transfer mode number		

5.1.9.11 Enable/disable read look-ahead

Subcommand codes AAh and 55h allow the host to request the device to enable or disable read look-ahead.

Error recovery performed by the device is vendor specific.

5.1.10 Set Multiple Mode

5.1.10.1 Command Code

C6h

5.1.10.2 Protocol

Non-data

5.1.10.3 Inputs

If the content of the Sector Count Register is not zero, then the Sector Count register contains the number of sectors per block for the device to be used on all following READ/WRITE MULTIPLE commands. The content of the Sector Count register shall be less than or equal to the value in bits (7:0) in word 47 in the IDENTIFY DEVICE information. The host should set the content of the Sector Count register to 1.

Table 34: Set multiple mode command for inputs information

Error register-

ABRT may be set to one if the device is not able to complete the action requested by the command.

LBA Low, LBA Mid, and LBA High, Device

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be cleared to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.12.6 Prerequisites

DRDY set to one.

5.1.12.7 Description

This command is used by the host to request the device to flush the write cache. If there is data in write cache, that data shall be written to the SSD. The BSY bit shall remain set to one until all data has been successfully written or an error occurs.

5.1.13 Standby

5.1.13.1 Command Code

E2h

5.1.13.2 Protocol

Non-data

5.1.13.3 Inputs

The value in the Sector Count register when the STANDBY command is issued shall determine the time period programmed into the Standby timer.

Table 43: Standby command for inputs information

Error register-

ABRT may be set to one if the device is not able to complete the action requested by the command.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be set to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.14.6 Prerequisites

DRDY set to one.

5.1.14.7 Description

This command causes the device to immediately enter the Standby mode.

5.1.15 Write Multiple

5.1.15.1 Command Code

C5h

5.1.15.2 Protocol

PIO data-out

5.1.15.3 Inputs

The LBA mid, LBA High, Device, and LBA Low specify the starting sector address to be written. The Sector Count register specifies the number of sectors to be transferred.

Table 49: Write multiple command for inputs information

Register	7	6	5	4	3	2	1	0
Features	Na							
Sector Count	Sector Count							
LBA Low	LBA(7:0)							
LBA Mid	LBA(15:8)							
LBA High	LBA(23:16)							
Device	obs	Na	obs	DEV	LBA(27:24)			
Command	C5h							

Sector Count-

Number of sectors to be transferred. A value of 00h specifies that 256 sectors shall be transferred.

LBA Low-

Starting LBA bits (7:0)

LBA Mid-

Starting LBA bits (15:8)

LBA High-

Starting LBA bits (23:16)

Device –

The LBA bit shall be set to one to specify the address is an LBA.

DEV shall specify the selected device.

Bits(3:0) starting LBA bits (27:24)

5.1.15.4 Normal Output

Table 50: Write multiple command for normal output information

Register	7	6	5	4	3	2	1	0
Error	Na							
Sector Count	Na

LBA High	LBA(23:16)							
Device	Obs	Na	obs	DEV	LBA(27:24)			
Status	BSY	DRDY	DF	Na	DRQ	Na	Na	ERR

Error register-

IDNF shall be set to one if a user-accessible address could not be found. IDNF shall be set to one if an address outside of the range user-accessible address is requested if command aborted is not returned.

ABRT shall be set to one if an error, include an ICRC error, has occurred during an Ultra DMA data transfer. ABRT shall be set to one if an address outside of the range of user-accessible address is requested if IDNF is not set to one.

LBA Low, LBA Mid, and LBA High, Device -

Shall be written with the address of first unrecoverable error.

Status register

BSY will be cleared to zero indicating command completion

DRDY will be set to one.

DF (Device Fault) will be set to one if a device fault has occurred.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.15.6 Prerequisites

DRDY set to one. If bit 8 of IDENTIFY DEVICE word 59 is cleared to zero, a successful SET MULTIPLE MODE command shall proceed a WRITE MULTIPLE command.

5.1.15.7 Description

This command writes the number of sectors specified in the Sector Count register.

The number of sectors per block is defined by the content of word 59 of the IDENTIFY DEVICE response.

When the WRITE MULTIPLE command is issued, the SECTOR Count register contains the number of sectors (not the number of blocks) requested. The device shall interrupt for each DRQ block transferred.

IF the number of requested sectors is not evenly divisible by the block count, as many full blocks as possible are transferred, followed by a final, partial block transfer. The partial block transfer is for n sectors, where:

N = Remainder (sector count / block count).

If the WRITE MULTIPLE command is received when WRITE MULTIPLE commands are disabled, the Write Multiple operation shall be rejected with command aborted.

Device errors encountered during WRITE MULTIPLE commands are posted after the attempted device write of the block or partial block transferred. The command ends with the sector in error, even if the error was in the middle of a block. Subsequent blocks are not transferred in the event of an error.

The contents of the Command Block Registers following the transfer of a data block that had a sector in error are undefined. The host should retry the transfer as individual requests to obtain valid error information. Interrupt pending is set when the DRQ bit is set to one at the beginning of each block or partial block.

5.1.16 Write Sector

5.1.16.1 Command Code

30h

5.1.16.2 Protocol

PIO data-out

5.1.16.3 Inputs

The LBA mid, LBA High, Device, and LBA Low specify the starting sector address to be written. The Sector Count register specifies the number of sectors to be transferred.

Table 52: Write sector command for inputs information

Register	7	6	5	4	3	2	1	0
Features	Na							
Sector Count	Sector Count

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.19.6 Prerequisites

DRDY set to one.

5.1.19.7 Description

This command transfer 512 byte of data from the host. Table 10 defines the content of this information. The data transferred controls the function of this command. Table 11 defines the interaction of the identifier and security level bits.

The revision code field shall be returned in the IDENTIFY DEVICE word 92. The valid revision codes are 0001h through FFFEh. A value of 0000h or FFFFh indicates that the Master Password Revision Code is not supported.

Table 64: Security set password command's data content

Word	Content
0	Control Word

	Bit 0 Identifier 0=set User password 1=set Master password Bits (7:1) Reserved Bit(8) Security level 0=High 1=Maximum Bits(15:9) Reserved
1-16	Password(32 bytes)
17	Master Password Revision Code()
18-255	Reserved

Table 65: Security Set password command's identifier and security level bit interaction

Identifier	Level	Command result
User	High	The password supplied with the command shall be saved as the new User password. The Lock mode shall be enabled from the next power-on or hardware reset. The device shall than be unlocked by either the User password it the previously set Master password.
User	Maximum	The password supplied with the command shall be saved as the new User password. The lock mode shall be enabled from the next power-on or hardware reset. The device shall then be unlocked by only the User password. The Master password previously set is still stored in the device but shall not be unlock
Master	High or Maximum	This combination shall set a Master password but shall not enable or disable the Lock mode. The security level is not changed. Master password revision code set to the value in Master Password Revision Code field.

ERR will be set to one if an Error register bit is set to one.

5.1.20.6 Prerequisites

DRDY set to one.

5.1.20.7 Description

This command transfers 512 bytes of data from the host. Table13 defines the content of this information. If the Identifier bit is set to Master and the device is in high security level, then the password supplied shall be compared with the stored Master password. If the device is in maximum security level then the unlock shall be rejected.

If the Identifier bit is set to user then the device shall compare the supplied password with the stored User password. If the password compare fails then the device shall return command aborted to the host and decrements the unlock counter. This counter shall be initially set to five and shall decremented for each password mismatch when SECURITY UNLOCK and SECURITY ERASE UNIT commands shall be command aborted until a power-on reset or a hardware reset. SECURITY UNLOCK commands issued when the device is unlocked have no effect on the unlock counter.

DRQ will be cleared to zero

ERR will be set to one if an Error register bit is set to one.

5.1.22.6 Prerequisites

DRDY set to one. This command shall be immediately preceded by a SECURITY ERASE PREPARE command.

5.1.22.7 Description

This command transfer 512 bytes of data from the host. Table12 defines the content of this information. If the password does not match the password previously saved by the device, the device shall reject the command with command aborted.

The SECURITY ERASE PREPARE command shall be completed immediately prior to the SECURITY ERASE UNIT command. If the device receives a SECURITY ERASE UNIT command without an immediately prior SECURITY ERASE PREPARE command, the device shall command abort the SECURITY ERASE UNIT command.

When Normal Erase mode is specified, the SECURITY ERASE UNIT command shall write binary zeroes to all user data areas. The Enhanced Erase mode is optional. When Enhanced Erase Mode is specified, the device shall write predetermined data patterns to all user areas. In Enhanced Erase mode, all previously written user data shall be overwritten, including sectors that are no longer in use due to reallocation.

This command shall disable the device Lock mode, however, the Master password shall still be stored internally within the device and may be reactivated later a new User password is set.

Table 75: Security erase unit password information

5.1.26.7 Prerequisites

DRDY set to one.

5.1.26.8 Description

This command enables the host to write the contents of one sector in the device's buffer.

The READ BUFFER and WRITE BUFFER commands shall be synchronized within the device such that sequential WRITE BUFFER and READ BUFFER commands access the same 512 bytes within the buffer.

5.2 MSATA 2SR Security Function

MSATA 2SR has several security functions, which can be triggered via host command.

5.2.1 QEraser/Destroy

QEraser function is designed for emergency data erase in few seconds. All data block of flash chip will be erased by sending Flash Erase Command.

Innodisk Destroy function implements an ultimate data erase of the SSD. Once Destroy is triggered. All the user data and SSD information, including SSD firmware, will be erased and UNRECOVERABLE. Destroy is optional.

5.2.2 SEraser

Security Erase function is designed for emergency data erasure to comply with military standard. Erase functions can be triggered by sending ATA Command. All data block of flash chip will be erased by sending Flash Erase Command. Security Erase standards are included AFFSI 5020, DoD 5220.22-M, USA Navy NAVSO P-5239-26, NSA Manual 130-2, USA-Army 380-19, NISPOMSUP Chap 8, Sect. 8-501, NSA Manual 9-12 and IRIG106. Identify Table can be read by sending ECh ATA command.

The value shows one of below functions.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be cleared to zero

5.2.2.6. NISPOMSUP Chap 8, Sect. 8-501

This function is compiled with NISPOMSUP Chap 8, Sect. 8-501 specification.

Step:

The whole disk is filled with fixed character pattern 0x55.

The whole disk is filled with fixed character pattern 0xAA.

The whole disk is filled with random data.

ERR will be cleared to zero

5.2.2.8 IRIG106

This function is compiled with IRIG106 specification.

Step:

The whole disk is erased using Flash Erase Command.

The whole disk is filled with pattern 0x55, and read back to verify.

The whole disk is erased using Flash Erase Command.

The whole disk is filled with pattern 0xAA, and read back to verify.

The whole disk is erased using Flash Erase Command.

Write 0x00 to all bad blocks. If there is any bit is still 1, the page is re-written 0 again. This procedure this repeated up to 16 times.

Erase all bad blocks and checked to determine if any zero are found. If any zeros are found, erase this block again. This procedure this repeated up to 16 times.

Write “Secure Erase” string to all blocks.

DRDY will be set to one.

DF (Device Fault) will be cleared to zero.

DRQ will be cleared to zero

ERR will be cleared to zero

Sector Count : The number of Erase Failure Block.

5.2.2.9 Get System Bad Block Data

This function is used to get SSD system bad block data.

Step:

This is 28-bit command for mSATA 2SR.

The Get Bad Block Data command allows the host to read data using the DMA data transfer protocol.

Bad Block Data transfer size is fixed to 65 sectors (33280 bytes).

An individual Bad Block Data Entry is represented by 4 bytes.

The Ch number is expressed by the Bad Block Data Entry ‘s first byte and the Bank number is expressed by the Bad Block Data Entry ‘s Second byte. The Block number is expressed by the remaining two bytes. If the four bytes data of the Bad Block Data Entry is all FFFF_FFFFh, then the Bad Block Data Entry shall be discarded as padding.

The following are two examples”

If the Bad Block Data Entry data is 0102_1030h, it means

Ch : 01h, Bank :02h ,Block:3010h.

If the Bad Block Data Entry data is FFFF_FFFF, it is an invalid entry.

ERR **will be cleared to zero**

5.2.3 Power Failure Issue

mSATA 2SR series integrated with real time power detection and auto recovery function. When power failure during data erasing, once power resupplied, SEraser would automatically resume the SEraser function till whole data is erased.
